ASSIGNMENT 4 REPORT

HASAN BARIŞ AYGEN

In this problem, there will a directory of files from root (./) My alogrith will first the databse.txt file which contains the informations about people. People have three different features. They are gender, name and surname. Algorith reads the file and assign values to the people struct and store them in an array. After that files are checked recursively if they are txt file sor they are directories. And for each txt file process checks whether the surnames and Mr. Or Mrs. Are correct or not. According to the database.txt informations, program corrects the mistakes by using fput() method.
